Quarterly issues of the Livestock and Meat Situation will be published in February, May, August, and November. Additional issues containing summary tables will be published in January, April, July, and October.

## SUMMARY

Total red meat production in the first quarter of 1980 was 5 percent larger than year-earlier levels and poulty production was up 10 percent. Large meat supplies, higher interest rates, and a slowing economy all acted in concert in late March and early April to drive livestock and poultry prices lower. Some of this decline was of a shortrun nature and prices have since recovered slightly. The large meat supplies and a slowing economy, however, will probably hold down meat price gains through most of 1980.

Per capita consumption of red meat on a retail weight basis declined to 147.6 pounds in 1979-2.1 pounds below 1978. However, this decline was more than offset by a 4.7 -pound gain in poultry consumption per person, which lifted total red meat and poultry consumption to a new high. Total red meat and poultry consumption will likely reach a record high in 1980. Further increases in pork production may boost pork consumption about 5 pounds per person, and poultry consumption may be up 1 to 2 pounds, more than offsetting a decline in beef consumption of 2 to 3 pounds.

In April farmers received the lowest prices for their hogs since June 1974, as record hog slaughter pushed prices below $\$ 30$ per cwt. Commercial slaughter during the first quarter was 21 percent larger than a year ago and the largest first quarter slaughter since 1971. Current hog inventories and a March-May pig crop that may be as large as a year ago suggest hog slaughter could be maintained at record levels through the fourth quarter, keeping pressure on hog prices. For the year, pork production is expected to increase about 9 percent, while hog prices decline about $\$ 7$ per cwt.

Although beef production in the first quarter was 5 percent below a year earlier, the fed cattle industry continues to be burdened by a slow marketing pace, excessive slaughter weights, and negative feeding margins. Reduced feedlot placements over the last couple of quarters will begin to result in reduced marketings late in the second quarter. The excess number of overfinished cattle should also be worked through the system this
quarter. Beef production is expected to exceed yearearlier levels in the second quarter, will fall below in the second half of the year. Reduced feedlot marketings will be partially supplemented by the increased slaughter of heavier steers and heifers off pasture in the second half of the year. Choice 900-1,100 pound steers at Omaha declined from about $\$ 68$ in early March to $\$ 61$ in early April as the industry adjusted to higher interest rates and a slowing economy. Fed cattle prices increased slightly through early May and are expected to average in the mid- $\$ 60^{\prime}$ s in the second quarter, with the highest prices coming late in the quarter.

An average of about $\$ 70$ is likely in the second half of the year. Beef production in 1980 is expected to be about 2 percent below 1979 levels, while Choice steer prices will probably average about the same as last year.

A slowdown in broiler output is expected in the second half of 1980 . Poultry producers, like other meat producers, are currently in a cost-price squeeze. However, broiler producers can adjust production levels faster than beef and pork producers. Thus, broiler production may only match year-earlier levels this summer and lag behind 1979 levels in the fall.

## FEED AND GRAZING PROSPECTS

Feed grain prices during the 1979/80 season ending this September are expected to average higher than last year. Domestic use will be larger and exports will exceed last year's record. Even though carryover stocks will be substantially larger than a year earlier, supplies readily avãilable to the market will be smaller because of larger stocks in the farmer-owned reserve and the CCC inventory.

Farm prices of feed grains have averaged higher each month during the current marketing year than in the same months a year ago. Despite record supplies, farm prices of corn are expected to average $\$ 2.35$ to $\$ 2.50$ per bushel, up from $\$ 2.25$ in 1978/79 and the $\$ 2.41$ average during JanuaryMarch. Farm prices of grain sorghum are expected to average $\$ 2.25$ to $\$ 2.35$ a bushel, compared with $\$ 2.02$ in $1978 / 79$ and $\$ 2.25$ for January-March. Soybean meal is expected to average $\$ 160$ to $\$ 180$ per ton, down from $\$ 190$ in 1978/79.

The April 1 planting intentions survey indicated incrêased corn and sorghum acreages and a slight decline in soybean acreage. Corn acreage is expected to increase $2 \frac{1}{2}$ percent to 82.0 million acres, while grain sorghum is expected to increase 5 percent to 16 million acres. Soybean acreage may decline by less than 1 percent.

Pasture and range feed conditions on May 1 were rated slightly below a year ago, but equal to the 1969-78 average for the date. Conditions throughout most of the nation were rated good to excellent, however some very dry conditions existed. Severe drought conditions covered most of North Dakota and extended into Montana. West Texas and some adjacent areas ranged from vary poor to extreme drought.

May 1 stocks of hay on farms were a record high 32.9 million tons, 10 percent more than last year and 37 percent above 1978. A high May 1, 1979 carryover, combined with record 1979 production resulted in record high stocks on both January 1, and May 1 of this year. The low cattle inventory and mild winter were also contributing factors.

## LIVESTOCK AND MEAT SUPPLIES

Total red meat production in the first quarter of 1980 was 5 percent larger than a year earlier. Poultry supplies were 10 percent larger. Large meat supplies, record-high interest rates, and a slowing economy all acted in concert in late March and early April to drive livestock prices lower. Some of this decline was of a shortrun nature and prices
have since recovered slightly. The large meat supplies and a slowing economy, however, will probably hold down meat price gains during most of 1980 .

## Cattle

## First Quarter Beef Production Declines

The fed cattle industry began 1980 under the continued burden of a slow marketing pace and heavy slaughter weights. Commercial beef production in the first quarter of 1980 was 5 percent below the first quarter in 1979. Commercial cattle slaughter declined 9 percent, but was partially offset by heavier slaughter weights. Fed-

erally inspected carcass weights averaged 653 pounds, versus 632 pounds a year ago. Heavier cow, bull and stag slaughter weights partially reflected the favorable grazing conditions in 1979 and the mild winter which resulted in the improved condition of the breeding herd. Weekly Federally inspected (F.I.) dressed cattle weights during the first quarter ranged from 20 to 30 pounds above a year earlier. Weekly F.I. cattle slaughter fluctuated around 600,000 head through mid-March as excessive numbers of heavier weight cattle in feedlots were being reduced. This reduction of heavier weight cattle suggested some strengthening in fed cattle prices.

However, high interest rates, the tight money supply and a slowing economy forced changes throughout the beef industry. Participants in the beef marketing chain, packers through retailers, reacted to the higher interest rates and increased uncertainties by reducing the quantities of beef held in the marketing channel. Packers were forced to cut their slaughter levels reducing the demand for fed cattle and cattle prices declined. During the second half of March and the first half of April, weekly F.I. slaughter ranged from 527,000 to 560,000 head-an average of 544,000 per week versus an average of 594,000 head during the previous 11 weeks. This lower level of slaughter resulted in a continued backup of heavy market ready cattle at feedlots. Prices for Choice fed steers at Omaha declined from about $\$ 67-\$ 68$ per cwt. in mid-March to about $\$ 61$ in early April. During the same period Central U.S. wholesale dressed beef prices declined from about $\$ 104$ per cwt. to $\$ 96$. Retail beef prices began to decline and beef was featured at lower prices in mid-April. On March 31, beef cold storage
stocks were 6 percent below February and 21 percent below year-earlier levels. Beef stocks probably declined further in April.

The reduction in beef stock levels in the marketing channel was a shortrun adjustment which was completed by late April. Once the new lower level of beef stocks was reached, the underlying demand and supply relationships began to take over and fed cattle and wholesale beef prices recovered a little.

However, the supply situation was further disrupted by the discovery of cattle which received Diethylstilbestrol (DES) implants after the October 31, 1979 ban on the use of this growth stimulant. DES implanted cattle must have the implant removed. After removal, these cattle must then be held off the market for 41 days provided the liver and kidney are not used for human consumption, or 61 days if the entire carcass is to be used. The number of DES cattle involved so far represents less than a week's slaughter. Some of the cattle being held off the market are believed not to have been implanted, but are mixed with implanted cattle in the same lots. The weight distribution of these cattle was not known in early May. Nevertheless, there are still a sizeable number of overfinished cattle that will need to be marketed through May.

## Feeder Cattle Supplies Build

Feeder cattle numbers outside feedlots continue above year-earlier levels. Despite a smaller 1979 calf crop, reduced feedlot placements and reduced nonfed cattle and calf slaughter have resulted in a larger supply of feeder cattle outside feedlots. On

Cattle on Feed, Net Placements and Marketings, 23 States

April 1, this year 32.8 million feeder cattle were outside feedlots, an increase of nearly 1.2 million head or 4 percent from last year. Supplies of calves weighing under 500 pounds were nearly 2 percent larger. Steers and heifers weighing 500 pounds and over, excluding replacement heifers, were 12 percent or 702,000 head above year-earlier levels.

Feeder cattle placements, and consequently feeder cattle prices, declined sharply as interest rates increased and large negative feeding margins continued. While there is much variation in interest rates paid by individual operators, commercial cattle feeding interest rates for many increased from around 10 percent in April 1979 to about 21 percent in April 1980. During this period interest charges per head increased from about $\$ 24$ to $\$ 61$, an increase of $\$ 37$ in a typical commercial cattle feeding program. This effectively reduces the price a cattle feeder can pay for a 600 -pound yearling by over $\$ 6$ per cwt .

Yearling feeder steers at Kansas City averaged in the low- $\$ 80$ 's during early March. However, as interest rates increased and fed cattle prices declined in late March and early April, feeder cattle prices declined to the upper- $\$ 60^{\prime} s$ to low$\$ 70$ 's. Given the adequate supply of feeder cattle outside feedlots, and prospects for only moderately higher fed cattle prices, yearling feeder cattle prices are not likely to increase much above the mid- to upper- $\$ 70$ 's during the spring and summer quarters. The beginning of the grazing season will give some price strength, particularly for lighter stocker cattle. In addition, many feeder cattle producers may decide to hold on to their feeder cattle through the grazing season in hopes of higher prices next fall. This may strengthen prices some this spring as fewer cattle are sold, but it
may also have a depressing effect on prices in late summer and early fall, particularly for heavy yearling cattle. If the calf crop is as large as expected this spring, these calves will place additional downward pressure on yearling cattle prices this fall.

Strengthening fed cattle prices and lower interest rates in late spring and summer may improve the prospects for feeder cattle prices. However, prices similar to those in 1979 are not likely until 1981 when total meat supplies are expected to decline and the economy strengthens.

## Fed Cattle Numbers Decline

On April 1 there were 8 percent fewer cattle and calves on feed in the 23 major cattle feeding States than a year earlier. Net placements during the first quarter were 10 percent below a year ago (total placements were down 11 percent) and marketings were down 9 percent. Cattle feeders indicated intentions to market 5.9 million head during the second quarter, 4 percent below year-earlier levels. These intentions should be met or exceeded.

Fairly large numbers of heavy cattle were in lots on April 1. Steers weighing over 1,100 pounds and heifers weighing over 900 pounds were 7 and 27 percent above year-earlier levels, respectively. This backlog of market ready cattle plus whatever market delays result from cattle held off the market because of the use of DES will cause continuing problems with overweight cattle through early June. However, reduced feedlot placements during the last two quarters should result in lower fed cattle marketings beginning late in the second quarter.

[^0] for management, production level and locality of

Comparatively low corn prices in the Western Corn Belt continue to be reflected in increased placements of cattle on feed in this area. While total placements for the 23 States were down 11 percent from year-earlier levels, placements in Western Corn Belt States were up substantially. Although in several of these States the number of cattle on feed are relatively small, the figures do indicate an increased interest in marketing grain through livestock. Placements during the first quarter, in three primary feeding States in this area, Minnesota, Illinois, and Iowa were up 29, 14, and 11 percent respectively.

While the 23 -State data provide information for the entire first quarter, the 7-State monthly report provides more specific information on developing patterns during the quarter. Placements in these States reporting monthly were 8 percent below yearearlier levels in February, and 18 percent below in March. Undoubtedly the sharper decline that started in mid-March continued in April. Feedlot placements are unlikely to show much strength until June, when the shortrun adjustments to the higher interests rates, heavy slaughter weights, and DES cattle should have been largely worked through the livestock system.

Negative feeding margins are expected to continue at least through this summer. Feeder cattle remain the largest cost component of cattle

${ }^{1}$ Intentions.
feeding, comprising about 60 percent of the total cost. The level of prices paid for feeder cattle placed on feed the last few months, plus larger supplies of competing meats, continued to hold down beef prices keeping cattle feeding in a losing position. As indicated in the custom feeding budget, cattle feeders have failed to cover all costs of production since June 1979 with losses ranging from $\$ 0.38$ to $\$ 13.99$ per cwt. sold. During much of this period, feeders have also failed to cover feed and feeder cattle costs. In March of this year, cattle feeders failed to cover all costs by $\$ 8.57$ per cwt. of fed cattle sold and failed to cover feed and feeder cattle costs by $\$ 1.60$ per cwt. sold.

Continued large supplies of competing meats and a slowing economy indicate the continued likelihood of negative net margins until at least this fall. However, recent declines in feeder cattle prices and lower interest rates may enhance profit prospects beginning this fall when cattle placed on feed since mid-March are marketed, particularly if inflationary prospects slow, the economy improves, and fed cattle prices strengthen.

## Lower Fed Beef Supplies And Strengthening Cattle Prices Ahead

Prospects for covering all cattle feeding costs are not expected to improve before this fall. However, cattle feeders should be able to cover feed and feeder cattle costs once the present backlog of overfinished cattle are marketed and prices strengthen later this quarter.

Commercial beef production in the first quarter of 1980 was 5,244 million pounds- 5 percent below yearearlier levels. Beef production in the second quarter is expected to be slightly above year-earlier levels, as cattle that should have been marketed in the first quarter are finally marketed. Although fed cattle marketings are expected to decline heavier, slaughter weights, and increased slaughter of heavier nonfed steers and heifers will increase production over the year earlier.

Beef production in the second half of the year will fall below year-earlier levels. Fed cattle slaughter is expected to drop well below year-earlier levels in the third quarter and slightly below in the fourth quarter. However, beef production will be held to within 1 to 2 percent of second-half 1979 production as larger numbers of steers and heifers are marketed off grass as the grazing season ends. Cow slaughter is also expected to increase as the grazing season ends and the spring calf crop is marketed. First quarter 1980 cow slaughter was 117,000 head below the same quarter in 1979. However, 1980 marks the second year of sharply reduced cow slaughter, and a larger number of older cows are expected to be marketed this fall.

${ }^{3}$ Clasšes estimated. ${ }^{2}$ Total, including farm production. ${ }^{3}$ Annual is weighted average.

Choice 900-1,100 pound steer prices at Omaha averaged $\$ 67$ per cwt. during the first quarter. Prices will likely average in the mid- $\$ 60$ 's in the second quarter. However, price fluctuations may be much greater than in the first quarter. Prices averaged $\$ 63$ in April, but may strengthen to around $\$ 70$ late in the quarter. Fed cattle prices are expected to increase moderately in the third and fourth quarters; however, the large supplies of competing meats, and reduced real incomes will likely prevent prices from rising above the low-\$70's.

## Veal Production

January-March commercial calf slaughter declined 18 percent from first-quarter 1979 levels. Veal production declined 20 percent. First-quarter per capita veal consumption declined from 0.5 pounds in 1979 to 0.4 in 1980. Choice vealers at South St. Paul averaged $\$ 89.90$ per cwt. a year ago, but only $\$ 71.58$ this past quarter. Veal calf prices have followed the generally weaker cattle market. Retail veal prices advanced from $\$ 2.51$ per pound in January-March 1979, to $\$ 3.04$ per pound in 1980.

## Beef Imports

Large supplies of meats have helped hold down meat prices. The large pork and broiler supplies and consequently lower prices have been
particularly competitive with imported beef, which is lean and normally processed into hamburger. Beef imports during the first quarter of 1980 were 515 million pounds, compared with the 678 million pounds imported in the same period in 1979. The New York price for imported beef declined from $\$ 1.43$ a pound at the beginning of the year to $\$ 1.11$ in early April. These less attractive prices, coupled with problems in some supplying countries, have lowered USDA's estimate of unrestrained meat imports subject to the Countercyclical Meat Import Law. The January 1 estimate was 1,650 million pounds, on a product weight basis, but the April 1 estimate was lowered to 1,571 million pounds. Under the revised formula of the meat import Act, the trigger level for the imposition of import quotas in 1980 is 1,668 million pounds. Beef imports are expected to be well below the trigger level.

Feeder cattle imports are also expected to be lower in 1980. Most of the these cattle come from Mexico. Meat shortages, which have troubled the Mexico City area during the past year, have been partially blamed on live cattle exports. From the start of the cattle quota year on September 1, 1979, to the end of March 1980, the Mexican Government has permitted only 411,000 head of the 519,000 head quota level to be exported to the United States. In 1979, 517,000 head of feeder cattle had been exported to the United States during the same period.

## Hogs

Record hog slaughter and slackening consumer demand pushed April hog prices below $\$ 30$ per hundredweight, the lowest since June 1974. The April 1980 average price for barrows and gilts at the 7 major terminal markets was $\$ 28.86, \$ 16$ below last April.

## First Quarter Hog Slaughter <br> Largest Since 1971

Hog slaughter under Federal inspection for the first 18 weeks of 1980 totaled 32.7 million head, up 19 percent from a year earlier. The average kill for this period was 1.82 million head per week and more than 2 million head were killed during the last 2 complete weeks of April. Slaughter for both weeks exceeded the previous record of 2.016 million set just last November. Slaughter is expected to decline seasonally for the last 8 weeks of the second quarter and may average 1.7 million head per week, 8 to 10 percent above a year earlier.

Hog slaughter under Federal inspection accounted for 95.6 percent of commercial hog slaughter during the first quarter of 1980. Total commercial slaughter was 24.2 million head, up 21 percent from a year ago and the largest first-quarter slaughter since 1971. (The record first-quarter commercial hog slaughter occurred in 1944 when 26.2 million hogs were slaughtered.)

Second quarter commercial hog slaughter could total 24.0 to 24.3 million head, nearly the same as the previous quarter and 9 to 11 percent above year-ago levels. Slaughter during April exceeded year-earlier levels by 15 percent, but inventory data suggest the year-to-year increase will diminish as

Commercial Sow Slaughter*

*Estimatod.
the second quarter progresses. The March 1 inventory of market hogs that would normally reach market weight early in the second quarter was up 12 percent; however, the inventory that is expected to reach market weight in the latter half of the quarter was up only 9 percent. Sow slaughter is expected to increase in May and June which would supplement barrow and gilt slaughter.

## Despite Low Hog Prices <br> No Liquidation Indicated

The sharply lower hog prices resulted in a much lower hog-feed price relationship even though corn prices were near year-ago levels- $\$ 2.31$ per bushel this April versus $\$ 2.27$ last April. The average price received by farmers for hogs in April was $\$ 27.60$, down from $\$ 44.10$ a year earlier. This resulted in the hog-corn price ratio declining to 11.9

to 1 , compared with 19.4 to 1 a year earlier. The ratio was even less favorable in areas outside the Corn Belt. The hog-corn price ratio in North Carolina, for instance, was 10.5 to 1 in April 1980, down from 17.1 last April. Because of the regional differences in corm prices, increases in sow slaughter may begin outside the Corn Belt. Sow slaughter in North Carolina and Georgia may be an early indicator of how fast and deep the liquidation will be.

SOWS FARROWING AND HOG/CORN RATIO

In spite of the much lower hog-corn price ratios, there was not any large year-to-year increase in sow slaughter through April. Sows accounted for 4.6 percent of the hogs slaughtered under Federal inspection during the first 2 weeks of April, up from 4.1 percent a year earlier. While the percentage of sows was up from a year ago, it does not indicate a large reduction in the breeding inventory is taking place. The number of sows sold at the 7 major markets also does not indicate a rapid liquidation is taking place. Sows accounted for 10 percent of all hogs sold at these markets during April, nearly the same as a year ago.

On March 1, hog producers in the 14 major hog producing States indicated that virtually the same number of sows would farrow during March-May of the year as did a year earlier. These intentions may be realized even though the March 1 breeding inventory was down 3 percent from last year. The performance of the breeding stock is more predictable this year because sows make up a larger proportion of it. Also, there were few indications of a large increase in the slaughter of pregnant sows during March or April.

The number of pigs saved per litter may increase from the year-ago level because older sows generally have larger litters. Over the past 2 years

ramsporation rate/cw

[^3]the number of pigs saved per litter during MarchMay averaged 7.20 , down from the 1970-1977 average of 7.29. A return to the 1970-1977 average would mean the March-May pig crop may be 1 percent larger than a year earlier if farrowing intentions are realized.

## Hog Prices To Average Below $\$ 40$ For Second Half 1980

Hog prices will remain under pressure of record hog slaughter, large pork stocks, large supplies of competing meats, and a weak economy. Hog slaughter during the second half of the year will be drawn primarily from the December-May pig crop. Slaughter could total 23.0 to 23.5 million head in the third quarter, up from 22.1 million head a year earlier. Fourth-quarter hog slaughter may total 25.0 to 25.5 million head, virtually the same as a year ago. Total slaughter for 1980 may be up about 9 percent from 1979 and the largest commercial slaughter on record.

Pork stocks are large compared with a year ago. There were 291 million pounds of pork in cold storage at the end of March, 18 percent above a year earlier and the largest March holdings since 1972. Pork belly stocks were up 26 percent from the previous month and 48 percent from a year earlier.

The projected slaughter levels may result in barrow and gilt prices averaging in the mid- to upper$\$ 30$ 's in both the third and fourth quarters. However, prices could be lower than projected if there were a big increase in sow slaughter. Such an increase could be the result of "panic" selling or higher corn prices. If a large increase in sow slaughter were to boost total hog slaughter above the projected levels, prices may then average $\$ 1$ to $\$ 2$ lower than indicated for the second half of the year.

## Hog Prices To Strengthen in 1981

The low prices anticipated for the rest of the year would result in returns to producers will not cover production costs and likely result in a reduction in farrowings during the second half of 1980. Farrowings may be down 5 percent during June-August and possibly as much as 10 percent during September-November. Hog prices may aver-
age in the low- to mid- $\$ 40^{\prime}$ 's during the first half of 1981 if such a reduction takes place.

## Poultry

Net returns to poultry producers this year have been sharply below year-ago levels. Estimated returns to broiler producers have been above production costs only 1 month since July 1979. Returns to turkey producers have been well below year-ago levels, but still above production costs.

Although broiler producers were unable to cover production costs, they continued to expand production in the first half of 1980. First-quarter output was up 7 percent and second-quarter output is expected to be up about 2 percent from a year earlier. However, broiler-type chick placements indicate that output may fall to or below year-earlier levels late in the quarter.

A slowdown in broiler output is expected in the second half of 1980 . Poultry producers, like other meat producers, are currently in a cost-price squeeze. However, broiler producers can adjust production levels faster than beef and pork producers. Thus, broiler production may only match year-earlier levels this summer and lag behind 1979 levels in the fall.

Turkey output is likely to continue year-to-year gains through the third quarter of 1980. In the first quarter, when production is usually at its seasonal low, output was almost 375 million pounds, up 38 percent from a year earlier. Second-quarter turkey production may be near 560 million pounds, up 20 percent from the same period last year. However, large cold storage stocks and reduced profitability may result in reduced output by this fall, being up only 1 to 3 percent.

The 9-city wholesale broiler price averaged 43 cents per pound in the first quarter, down from 47.5 cents a year earlier. Prices may average near 40 cents per pound in the second quarter, down from 47.7 cents a year ago. Second-half broiler prices will depend greatly on the level of pork production, but are expected to average in the mid40's. Turkey prices will be under pressure of large stocks of turkeys and large pork supplies, so turkey hen prices at New York may average in the upper50 's or low-60's during the second half of the year, compared to 68 cents in the second half of 1979.

${ }^{1}$ Classes estimated. ${ }^{2}$ Total, including farm production. ${ }^{3}$ Weighted annual average. ${ }^{4}$ Preliminary.

## CONSUMPTION AND PRICES

Per capita consumption of red meats on a retail weight basis declined to 147.6 pounds in 1979, 2.1 pounds below 1978 and the lowest level since 1975. However, poultry consumption increased by 4.7 pounds, more than offsetting the decline in red meats. Thus, total consumption of red meats and poultry rose to a record-high 209.2 pounds, 2.4 pounds more than in 1978. Beef consumption declined 9.3 pounds in 1979 to 79.6 pounds because of decreased production. This was the largest year-to-year decline in beef consumption on record and the lowest consumpton since 1967. Veal and lamb and mutton consumption also declined, 0.9 pounds and 0.1 pound, respectively. However, increased
pork consumption almost offset the decline in the other red meats. It rose to 65.1 pounds, 8.2 pounds above a year earlier and was the largest amount since 1971. Meanwhile, poultry consumption in 1979 increased to 61.6 pounds. This was comprised of 48.5 pounds of young chicken, 3.0 pounds of other chicken, and 10.1 pounds of turkey.

Although record quantities of meats were consumed in 1979, the percent of consumers' disposable income spent on meats increased less than 0.1 percent from the previous year. About 4.4 percent of disposable income was spent on meats in 1979, up from 4.3 percent the previous year. Expenditures for red meats, young chicken, and turkey in 1979 were estimated to be $\$ 323$ per person. Of these expenditures, $\$ 180$ was used to

[^4]purchase beef, $\$ 93$ to purchase pork, and $\$ 42$ to purchase young chicken and turkey.

Total red meat and poultry consumption will likely reach a record high in 1980. Further increases in pork production may boost pork consumption about 5 pounds per person, and poultry consumption may be up 1 to 2 pounds, more than offsetting a decline in beef consumption of 2 to 3 pounds.

Red meat consumption in the first quarter of this year was sharply above year-earlier levels as pork consumption increased to 17.5 pounds per person, 2.7 pounds above a year earlier. Beef consumption, however, was down 1.6 pounds from the previous year level of 20.9 pounds. Consumption of poultry meats continued to rise during the first quarter, resulting in a record-high first-quarter total meat consumption of around 52.5 pounds.

Preliminary Department of Commerce data indicate per capita disposable personal income in the first quarter of 1980 was 2.9 percent greater than the previous quarter, but real per capita disposable income was unchanged. Incomes may rise but not as fast as prices for several more quarters. Because of the large supplies of meat and the slow income growth, meat prices are expected to increase less than prices of most nonfood items during 1980.

This situation is apparent by the moderation of retail meat price increases during the first 3 months of 1980. The Consumer Price Index (CPI) for meat in March was only 1.4 percent above December 1979. Beef and veal prices increased 2.6 percent, but pork prices continued to decline and were 1.2 percent below the December level. Poultry prices increased only 2.6 percent over this period. The stability of retail meat prices during the first 3 months of 1980 is in sharp contrast with a year ago when the CPI for meats rose 11 percent over the first 3 months, led by a 17 -percent increase in beef and veal prices.

Meats (beef and veal, pork, and other meats) and poultry account for approximately 20 percent of food expenditures in the calculation of the CPI, so the stability of these prices have moderated the food price increase and kept the overall rate of inflation from increasing at an even faster rate. Food prices in March 1980 were 2.3 percent above December 1979 levels, while nonfood items were 4.7 percent higher.

Retail meat prices are expected to remain relatively stable during the second quarter of this year before increasing moderately during the second half. Beef and veal prices during the second quarter are expected to average less than 2 percent above the previous quater, but pork prices may average 3 to 5 percent lower. A slight decline in retail poultry prices is expected from the previous
quarter. In the second half of 1980 , pork prices may increase from the second-quarter lows and exceed year-arlier levels; however, the average price of 1980 may still be 3 to 5 percent below 1979 levels. Beef and veal prices may increase 4 to 6 percent in the second half of the year from the first half and average 6 to 8 percent above 1979 levels for the year. Second-half retail poultry prices probably will also rise from the first-half level and average higher than during the second half of 1979. For all of 1980 , poultry prices may average slightly higher than they did in 1979.

## Beef Marketing Margins Increase

Although first-quarter beef and veal prices were 11 percent above year-ago levels, Choice steer prices at Omaha averaged only 2 percent higher. A widening farm-retail spread limited the increase in the steer price. The spread averaged 92 cents per pound in the first quarter of this year, 18 percent above a year earlier. Increased processing costs due to lower capacity utilization because of the reduced cattle slaughter and higher input costs contributed to the expanded spread. However, an important factor which reduced the farm value of cattle (and thereby increased the spread) was the year-to-year decline in the cattle by product value. In the first quarter of 1980, the byproduct value averaged 17.3 cents per retail pound, down from 21.1 cents a year earlier.

The hide component of the byproduct value decreased the most. Prices for hides fell steadily since the beginning of the year; by the end of March the price of Colorado branded hides at Central markets fell to $\$ 29-\$ 31$ per hundredweight, down from the mid- $\$ 50$ 's in early January. A year ago, exactly the opposite occurred: January 1979 began with prices near $\$ 50$, but by March prices had increased to the low-\$70's and peaked in May near $\$ 90$. Prices fell after May and remained in the mid- $\$ 50$ 's for most of the second half of 1979.

The decrease in the value of the hides alone reduced the byproduct value of a 1,000 -pound steer this March by almost $\$ 30$ from year-ago levels. If packers reduced their bids for cattle because of this decline, it would be equivalent to about $\$ 3$ per hundredweight.

While processing and distribution costs have also gone up for pork, the farm-retail spread in the first quarter increased only slightly. The pork farm-retail spread averaged 76.7 cents per pound during January-March, up only 2.5 percent from the first quarter of 1979. Better capacity utilization due to the large increase in pork production in combination with more "specials" of pork products at the retail level likely contributed to keeping the price spread from increasing faster.

${ }^{3}$ Revised series. ${ }^{2}$ Estimated wrighted average price of retail cuts from Choice Yield Grade 3 carcass. ${ }^{3} V$ alue of carcass quantity equivalent to 1 ib . of retaji cuts. A wholesale carcass equivalent of 1,464 was used prior to 1970 it was increased aradually to 1,476 in 1976 and later years. Portion of gross carcass value attributed to fat and bone trim. ${ }^{5}$ Gross carcass value minus carcass byproduct allowance. ${ }^{5}$ Market value to producer for quantity of live animal equivalent to 1 lb . of retail cuts. The farm product equivalent of 2.36 was used prior to 1970 it was increased gradually to 2.40 in 1976 and later years. portion of gross farm value attributed to edible and inedible byproducts. Gross farm value minus farm byproduct allowance. Percent net farm value is of retail price.

${ }^{1}$ Revised series. ${ }^{2}$ Estimated weignted average price of retail cuts from pork carcass. ${ }^{3}$ Value of wholesale quantity equivalent to 1 1b. or retail cuts. A wholesale carcass equivalent of 1.06 is used for all years. ${ }^{4}$ Market values to producer for quantity of live animal equivalent to 1 lb. of retail cuts. The farm product equivalent of 2.12 was used prior to 1959 ; it was decreased gradually to 1.70 in 1977 and later. ${ }^{5}$ Portion of gross farm value attributable to edible and inedible byproducts. ${ }^{6}$ Gross farm value minus byproduct allowance. Percent net farm value is of retail price.

Supply and distribution of commercially produced meat, by months, carcass weight
